TO: File

FROM: Frank J. Filas, Reclamation Engineer 

RE: Site Inspection, DOE/O19/029, Judy No. 1 & 2

On July 7, 1987, Frank Filas inspected the above-referenced quarry operation. The site can be accessed by taking old Highway 6 east out of Green River and turning south onto a gravel road 4.5 miles east of the river. This road will take you southwesterly back to the river. Take a right at the river and travel approximately one-half mile to the quarry, which will be on the right.

The travertine rock is being drilled and blasted off the side of a hill. There is a pile of loose rock at the foot of the hill and a series of small benches leading up the side of the hill. Total surface disturbance is less than two acres. It is doubtful if any reclamation work will ever be needed on this site because the broken rock on the side of the hill blends in well with the surrounding area.

The travertine is a very pretty rock that was formed by geothermal action. The deposit is quarried on an intermittent basis, and the rock is used for making ornamental clocks. The site is located on a Bureau of Land Management lode claim and is covered under a Notice of Intent with the Grand Resource Area.
